

POC:

Directions:

INSTALLED -- AFFF in Fire and Emergency Services (F&ES) trucks, trailers, or dispensing tanks; not in manufacturers shipping containers.

This datacall when complete should document all INSTALLED AFFF in F&ES trucks, trailers, or dispensing tanks; not in manufacturers shipping containers.

COs are requested to share the datacall results F&ES, Environmental, and NAVFAC - Public Works must coordinate to ensure data integrity.

The data contained in this table was generated by a CNIC F&ES datacall
<https://hq.ahf.nmci.navy.mil/taskerfind&bA78FRD>, Feb 2016.

It is VERY IMPORTANT the data previously entered is validated/corrected, and the additional data fields are populated. DO NOT count AFFF installed in fire suppression systems or on ships.

Rules of Engagement:

1. Inventory ONLY firefighting foams agents installed in fire apparatus, trailers, or dispensing tanks.
 2. Only count the AFFF in the AFFF tank. AFFF in cans pre-positioned on the apparatus will be recorded on the "Uninstalled - Ready Reserve" spreadsheet.
 3. DO NOT count AFFF installed facility fire protection systems. Refer to "INSTALLED Fixed System"
 4. Use pull down menu(s) before typing. If the choice is not available enter the complete nomenclature as written on the product container and click "Yes" on the pop-up warning message.
 4. Use your best judgment as to the brand of AFFF in the tank.
 5. Use the tank capacity or ESTIMATE the amount of AFFF (gallons) in the vehicle or trailer...it is NOT necessary to drain tanks in order to determine the amount.
 6. Determine the total amount (gallons) of each tank on F&ES apparatus, trailers, or dispensing tank by the vehicles NSN and/or tank location documenting the AFFF brand name, class, percentage.
- Add a new row for each "F&ES apparatus, trailers, or dispensing tank."

CNIC will total each Region input for the Enterprise totals for each "brand name, class, percentage, by location."
